EDUCATION

BENNETT UNIVERSITY

2022 – 2026

Bachelor of Technology in Computer Science and Engineering

CGPA: 8.86 / 10.00

Data Scientist: Aspiring Data Scientist with expertise in Python, machine learning, and data analysis. Experienced in data preprocessing, predictive modeling, and analytical problem-solving, with a focus on developing scalable solutions and extracting meaningful insights from data. Also, I have a strong interest in Data Structures and Algorithms, Object Oriented Programming, Database Management System, Computer Networks, Statistical Machine Learning, Natural Language Processing

TECHNICAL SKILLS

Languages Python, SQL

Libraries : NumPy, Pandas, Matplotlib, Seaborn, Scikit-learn

DB/Tools: AWS, Git, Docker, Power BI

Machine Learning: Feature Engineering, Model Evaluation, Hyperparameter Tuning, Predictive Modeling, TensorFlow

NLP: Text Preprocessing, TF-IDF, Word Embeddings, Transformers (BERT), Hugging Face, Text Classification, Sentiment Analysis

PROJECTS

Context-Aware Fake News Detection using BERT + Explainable AI *Python, Transformers (BERT, Hugging Face), SHAP, TensorFlow, Streamlit (Deployment)* — **Github**

- Developed a context-aware fake news detection system using BERT and Hugging Face Transformers
- Implemented explainable AI techniques (SHAP) to interpret model predictions
- Achieved 93% accuracy and 0.92 F1-score using a fine-tuned BERT model, improving performance over baseline models.
- Deployed the model using Streamlit for real-time predictions

Predict loan defaults using ML + DL with explainable insights *Python, TensorFlow (ANN - DL), SHAP, Scikit-learn (ML models), Matplotlib, Seaborn* — **Github**

- Developed an explainable loan default prediction system using hybrid ML and deep learning models
- Performed feature engineering and handled imbalanced data to improve model performance
- Achieved **92% accuracy and 0.90 F1-score** using optimized models
- Implemented SHAP-based explainability to interpret model predictions and feature importance

Hybrid Demand Forecasting using ML & LSTM *Python, Transformers (BERT, Hugging Face), SHAP, TensorFlow (LSTM), Matplotlib, Seaborn, Streamlit dashboard* — **Github**

- Developed a hybrid demand forecasting system using machine learning models and LSTM for time series prediction
- Engineered time-based features and lag variables to capture trends and seasonality
- Achieved **low RMSE and improved forecast accuracy** compared to baseline models
- Performed model comparison between traditional ML and deep learning approaches to select optimal solution

ACHIEVEMENTS

- Spin the Code 2022 — Ranked **12th** out of 1000+ participants.
- Smart BU Hackathon 2023 — Ranked **73 / 500**.
- Solved **950+** DSA problems on LeetCode, GeeksforGeeks and Coding Ninjas.
